

LightScribe Technology

LightScribe Version 1.2 has arrived!

Now, create professional labels in a third less time!

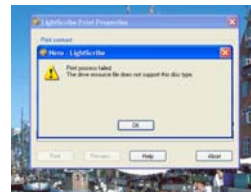

Things You Should Know About v.1.2

LightScribe technology is a joint development between Verbatim and HP. Version 1.2 is now available in CD-R and DVD+R media. It is also called High Sensitivity or HS media. HS media will burn your LightScribe labels in a third less time than the original LightScribe media (less than 20 minutes for a full surface hi-resolution image).

When you insert the new version 1.2 media in your drive the first time, you will be prompted to download the latest LightScribe Host Software. This update can typically be obtained through your hardware brand provider. The prompt should take you direct to your drive manufacturer's website. A universal update will also be available from the LightScribe website (www.lightscribe.com).

If you try and close the prompt window without selecting an option, you will receive an error message stating the drive does not support the media. The prompt will also give you the option to print at a reduced quality, if you don't want to download the software immediately.

Product Range

Part #	Description
95116	HS LightScribe DVD+R 4.7GB Spindle Box 10pk 16x
